

Stable Isotope-Labeled Standards and Mixtures for Lipidomics

For Qualifying, Quantifying, and Monitoring Fatty Acids and Lipids

Fatty acids and lipids are important biological compounds that are essential to the regulation and control of cellular functions and metabolic pathways. These biomolecules are also tied to the energetic balance of an organism. Their qualitative/quantitative analysis has emerged to better understand the underlying pathophysiology, as well as to identify new biomarkers or diagnose existing ones.

CIL is pleased to offer a multitude of stable isotope-labeled (and unlabeled) fatty acids and lipids in their individual standard or mix form. The fatty acids cover saturated and unsaturated classes, while the lipids include ceramides and phospholipids along with triacylglycerides. These are available in various labeling patterns (i.e., uniform, partial), forms (i.e., free acid, salt, ester), and material grades (i.e., research, MPT). Additional standards may be available.
