## Standards for qNMR

Quantitative  $^1\text{H}$ -NMR (qNMR) continues to be utilized with much success in the pharmaceutical, chemical and food industries and in many facets of academic research. Regardless of the application, all qNMR methods require a calibration signal whose integrated signal intensity originates or is traceable to a known number of protons. Calibration for qNMR is made using either internal or external referencing methods. External methods rely on the use of a standard solution packaged in a defined NMR tube or capillary to obtain an integral that can be used for sample quantification, whereas internal methods rely on the use of a known amount of standard that is co-dissolved in the sample itself.

### External Calibration Standards

CIL is pleased to offer external calibration standards for qNMR. The standards are formulated using CIL's high-quality DMSO-d<sub>6</sub> and benzoic acid from NIST (SRM 350(b)), a standard reference material for acidometry. Both 5 mM and 15 mM benzoic acid concentrations are available. The concentration and associated expanded uncertainty of the benzoic acid has been accurately determined using metrological techniques and verified using qNMR. The  $^1\text{H}$ -NMR spectrum of benzoic acid in DMSO-d<sub>6</sub> is presented in Figure 1.

CIL is currently offering these standards in presealed NMR tubes. Please see the information below for details regarding NMR tubes and fill volumes. Other NMR tubes and concentrations may be available upon request.

## CIL Formulation Procedure

The procedure that CIL uses to formulate qNMR external calibration reference standard bulk solutions allows for the expanded uncertainty of the concentration of the calibration standard (e.g., benzoic acid) to be determined. Traceability to SI is maintained through the use of weight sets with calibration

traceable to NIST and laboratory balances with NIST-traceable calibration certificates, maintaining an unbroken chain of calibration to the kilogram. The factors contributing to the uncertainty of the benzoic acid concentration<sup>1</sup> is shown in Figure 2.

## qNMR Standards for Internal Referencing

The internal reference method commonly gives errors of <1% and is considered to be the most accurate and reproducible method available to obtain quantitative  $^1\text{H-NMR}$  spectra. Unfortunately, the reference standard is typically weighed into each sample solution, an action that requires time and effort, and has been reported to be the largest source of error with this method.

CIL is pleased to offer a ready-to-use DMSO-d<sub>6</sub> solution containing a known amount of benzoic acid for internal referencing. Because this solution is preformulated, the user does not need to weigh a

standard material. The elimination of this step will reduce effort and time in sample preparation and also may bring about more accurate results than if the user performs this formulation. To use this product, the sample must be soluble in DMSO-d<sub>6</sub>, physically and chemically inert toward benzoic acid and stable in acidic pH. Ideally, there will be no resonances from the sample in the region of benzoic acid aromatic protons (7.4-8.1 ppm), HOD (~3 ppm but is variable) and DMSO-d<sub>5</sub> (2.5 ppm). The benzoic acid concentration with associated uncertainty is presented on the certificate of analysis.

### Kit Features and Benefits

- Enables analytical precision to be determined
- Allows metabolite quantitation
- Identifies performance deficits
- Pinpoints method-specific issues
- Diminishes interlaboratory variability
- Improves method transferability

**Looking to assess the performance of your metabolomic workflow? Use CIL's QC kit.**

This QC kit is designed to evaluate the efficiency of a user's metabolomics method and LC-/GC-MS platform such that the analytical variation can be determined and corrected. Testing and validation of the kit has been performed in an array of matrices (e.g., urine, blood, and tissues), using different forms of chromatography (e.g., RP-LC and HILIC), ionization polarity (i.e., positive and negative), and modes of MS (e.g., DDA). By simply rehydrating and pooling aliquots of the supplied mixes, the isotopically labeled metabolites are ready for use either as spike-in standards to your biosample of interest (for quantitation) or for independent analysis at defined points of an analytical batch (for QC). In system suitability assessment, such metrics as retention time, peak shape, and signal intensity should be monitored over time for performance accreditation.

## Heavy-Labeled MS Protein Standard for Bottom-Up Proteomics

Human ApoA-1 (<sup>15</sup>N, 98%)

Catalog No. NLM-9539

### Significance

Apolipoprotein A-1 (ApoA-1) is the primary protein component of high-density lipoprotein (HDL) in plasma and has a specific role in lipid metabolism. It is a structural and functional protein that promotes cholesterol efflux from tissues to the liver. Testing for ApoA-1 is used to approximate HDL levels in a subject, which can be used to help determine a person's risk for developing cardiovascular disease. By combining the power of LC/MS and a heavy-labeled ApoA-1 internal standard, accurate quantitation of this protein in a biological sample is achievable using a bottom-up proteomic workflow.<sup>1</sup>

### Product Description

Human ApoA-1, uniformly labeled <sup>15</sup>N enriched, dissolved in phosphate-buffered saline at a nominal concentration of 2 mg/mL.

# IROA® Biochemical Quantitation Kits for Metabolic Profiling

An innovative technology termed isotopic ratio outlier analysis (IROA) was developed to overcome the analytical challenges associated with current, stable isotope-assisted methods used in untargeted/targeted metabolic profiling.<sup>1</sup> These challenges minimally pertain to analytical variance, artifactual peaks, and metabolite identification. The IROA method uses metabolic incorporation of heavy (95% <sup>13</sup>C) and light (5% <sup>13</sup>C) nutrients, such as D-glucose and other carbon energy sources, to give rise to unique labeling patterns that can be readily identified and distinguished by MS. Such a method would be useful in interlaboratory quantitative evaluations, if widely available.

**Cambridge Isotope Laboratories, Inc. (CIL) is proud to offer a series of IROA® Biochemical Quantitation Kits for metabolic profiling of various cell populations and biological samples.** These kits contain the reagents and tools necessary for the successful labeling, identification, and quantitation of metabolites in various cell populations (see general product info below).

## Performing cellular metabolic profiling? Use the IROA protocol.

In the basic IROA protocol, biomolecules in two cell populations (control and experimental) are randomly labeled with stable isotopic media (<sup>13</sup>C-based). After a defined incubation period (with 5+ cell doublings), the experimental group is perturbed

**Figure.** LC-MS analysis of the endometabolome of heat-shocked *Caenorhabditis elegans* grown on agar plates with IROA  $^{13}\text{C}$ -labeled *Escherichia coli* as its food.<sup>2</sup> Based on mass spectral spacing and relative intensities, biogenic peaks (in blue) could be differentiated from artifactual noise (in red), which lead to the identification of lysophosphatidylethanolamine 18:1 having a formula of  $\text{C}_{23}\text{H}_{46}\text{NO}_7\text{P}$ .

(through a chemical, genetic, or environmental stressor) before uniform mixing, sample preparation, and LC-MS analysis. Note: unlabeled bacterial and mammalian media are available for cell growth testing and adaptation.

Compared to conventional labeling approaches (e.g., SILAC), the reduced enrichment enables isotopic distributions to be readily detected by MS in a predictable and distinguishable manner. These distributions can then be used to: (i) differentiate biological signals from artifacts, (ii) calculate accurate molecular formulae, and (iii) determine relative concentrations of the metabolites of biogenic origin. This data-analysis process is aided by IROA Technologies ClusterFinder™ software (see figure above). For experimental samples that cannot be labeled in culture systems (such as biopsies and large-scale fermentations), the IROA Phenotypic protocol can be applied to prepare a relevant labeled internal standard to use as a yardstick to compare differences between experimental cell populations.

# PeptiQuant™ MRM Assay Kits – Human

Researchers in academia and life science industries continue to adopt a targeted, bottom-up MS-based proteomic workflow for candidate biomarker evaluation (from discovery to preclinical validation) and systems biology investigations. These analyses require absolute quantification of surrogate peptides in the sample matrix, a requisite that is best achieved with stable isotope-labeled standards (SIS, commonly peptides) in conjunction with an MRM or PRM detection technique. Although the use of SIS has increased the reliability of LC-MS/MS-based assays, optimal results require properly functioning equipment and a workflow with minimal human error and bias.

To help researchers establish a stable LC-MS/MS platform for bottom-up quantitative proteomics of human plasma, Cambridge Isotope Laboratories, Inc. (CIL) is pleased to offer PeptiQuant™ QC kits from MRM Proteomics Inc. These kits include the **PeptiQuant™ Monthly LC-MS Platform Performance Kit**, the **PeptiQuant™ Daily LC-MS Platform Performance Kit**, and the **PeptiQuant™ Workflow Performance Kit**. These innovative products are used to assess and track the performance of the LC-MS platform in a proteomic workflow in order to highlight any possible issues that will ultimately affect quantitation. Note: these kits are designed for matrix-specific analysis and also are available for use with mouse plasma (see PeptiQuant™ MRM Assay Kits – Mouse data sheet).

CIL is also pleased to offer the **PeptiQuant™ Biomarker Assessment Kit** (BAK-76), to help researchers screen a multitude of proteins in human plasma samples. Researchers in academia and life science industries continue to adopt a targeted, bottom-up MS-based proteomic workflow for biomarker discovery and validation. Biomarker validation requires absolute quantification of surrogate peptides in the sample matrix, a requirement that is best achieved with stable isotope-labeled standards (SIS, commonly peptides). Although the use of SIS has increased the reliability of LC-MRM/MS-based assays, optimal results require properly functioning equipment and a workflow with minimal human error and bias.

To help researchers establish a stable LC-MRM/MS platform for bottom-up quantitative proteomics of mouse plasma, Cambridge Isotope Laboratories, Inc. (CIL) is pleased to offer PeptiQuant™ QC kits from MRM Proteomics Inc. Note that these kits are also available for human plasma (see the PeptiQuant™ MRM Assay Kits – Human data sheet). All mouse PeptiQuant™ kits were developed using the C57BL/6 strain. The QC kits include the **PeptiQuant™ Monthly LC-MS Platform Performance Kit – Mouse**, the **PeptiQuant™ Daily LC-MS Platform Performance Kit – Mouse**, and the **PeptiQuant™ Workflow Performance Kit – Mouse**. These innovative products are used to assess and track the performance of the LC-MS platform in a proteomic workflow, which can help the user pinpoint any possible issues affecting quantitation.

CIL is also pleased to offer the **PeptiQuant™ Biomarker Assessment Kit – Mouse (BAK-81)**, to help researchers screen a multiplexed panel of proteins in mouse plasma. This turnkey solution contains the materials and tools necessary to monitor up to 81 proteins of biological importance in mouse plasma samples.

## Benefits of PeptiQuant™ Kits – Mouse

- Acquire more precise and accurate quantitative data
- Identify performance deficits related to your equipment
- Pinpoint method-specific issues that need to be addressed
- Diminish interlaboratory variability
- Improve method transferability

## PeptiQuant™ Monthly LC-MS Platform Performance Kit

Tests the effectiveness of your LC-MS platform in protein quantitation. The PeptiQuant™ Monthly LC-MS Platform Performance Kit is used to ensure the researcher is able to generate acceptable levels of quantitation when starting with prespiked, predigested mouse plasma. Using the reagents in the kit, the researcher can compare the obtained results for different peptides to the "known" reference values. This comparison allows the user to address any issues with the performance of their LC-MS system.

## PeptiQuant™ Workflow Performance Kit

Evaluates the performance of your entire analytical workflow (from denaturation to detection) for mouse plasma analysis. The PeptiQuant™ Workflow Performance Kit is used to assess the entire proteomic workflow starting with raw mouse plasma. The user compares the obtained results for 34 different peptides to the "known" reference values that are given in the kit. This comparison allows the user to address any issues with the performance of their LC-MS platform or workflow before running actual samples.

## PeptiQuant™ Daily LC-MS Platform Performance Kit

Monitors the reproducibility of your LC-MS platform. Once baseline values are obtained, the PeptiQuant™ Daily LC-MS Platform Performance Kit can track chromatographic and MS performance on a daily basis over time.

## PeptiQuant™ Biomarker Assessment Kit (BAK-81)

The PeptiQuant™ Biomarker Assessment Kit is used for quantification of up to 81 different proteins of biological importance in user-supplied mouse plasma.

Similar kits are available for use with human plasma. Please inquire.

**Assess the suitability of your LC-MS platform!****PeptiQuant™ Monthly LC-MS Platform Performance Kit – Mouse**

The PeptiQuant™ Monthly Use Kit – Mouse, developed using the C57BL/6 mouse strain, was designed to evaluate if the performance of your LC-MS platform will meet the requirements of your quantitative proteomics application. This kit will allow users to test the effectiveness of their LC-MS platform in terms of LC variability and detection sensitivity. Additionally, the PeptiQuant™ Monthly Use Kit – Mouse allows the user to monitor various quantitative parameters such as limits of quantitation, dynamic range, precision, and endogenous concentration. The use of this kit may reveal the presence of instrument-specific issues that should be addressed prior to running actual samples.

The supplied standards are lyophilized and ready for LC-MRM/MS analysis upon reconstitution. Users can compare their quantitative results to the “known” protein values provided in the reference kit for performance evaluation.

Each kit contains the following items:

- Six vials containing lyophilized mouse plasma digests that have been spiked with different concentrations of a balanced SIS peptide mixture covering two orders of magnitude
- Lyophilized SIS peptide mixture in buffer
- Dilute formic acid (solution)
- Protocols and tools on a USB drive\*

# PeptiQuant™ MRM Assay Kits – Apolipoproteins

Researchers in academia and life science industries are progressively adapting a targeted, bottom-up MS-based proteomic workflow for disease biomarker evaluation and systems biology investigations. This requires absolute quantification of surrogate peptides in the sample matrix, a requisite that is best achieved using stable isotope-labeled standards (SIS, commonly peptides) in conjunction with an MRM or PRM detection technique. Although the use of SIS has increased the reliability of LC-MS/MS-based assays, to improve the interlaboratory precision and enable more widespread use of this "absolute" quantitative technique in disease biomarker assessment studies, methods must be standardized.

CIL is pleased to offer the **PeptiQuant™ Biomarker Assessment Kit – Apolipoproteins (APO-14)**, to help researchers screen the biomarker utility of a panel of apolipoproteins in human plasma samples. Specifically, this kit contains the necessary materials (e.g., concentration-balanced SIS mixes and protocols) and tools (for acquisition and analysis) to quantify up to 14 apolipoproteins in human plasma samples.

## Benefits of the PeptiQuant™ Apo-14 Kit

- Standardize biomarker assessment
- Diminish interlaboratory variability
- Improve method transferability

## Performing protein biomarker evaluation?

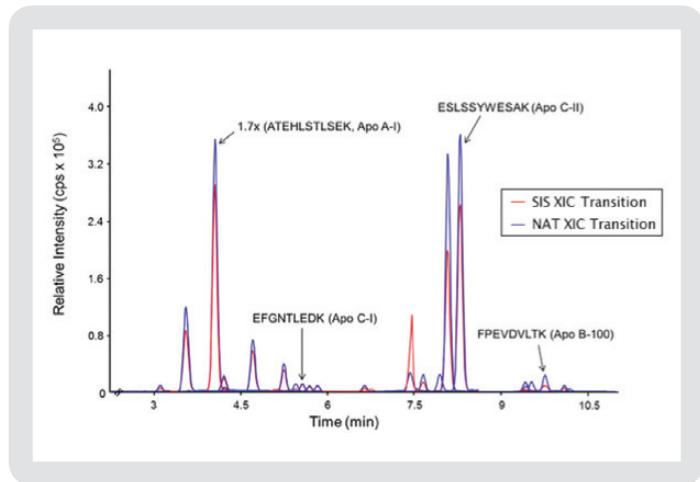

The **PeptiQuant™ Biomarker Assessment Kit – Apolipoproteins (APO-14)** has been developed for the rapid and precise quantitation of 14 plasma apolipoproteins (see list on back) utilizing 27 surrogate peptides (see figure on back), valuable in small- and large-scale biomarker assessment (from discovery to preclinical validation) studies. The APO-14 provides an easy solution for non-expert users to rigorously assess the utility and significance of 14 apolipoproteins in various disease states with only 10 µL of human plasma per sample.

The apolipoproteins can be quantified in the user-supplied reference (or control) human plasma and the user's experimental (or patient) samples from 27 peptide surrogates using a quantitative approach involving linear regression analysis of peptide standard curves. The software tool – Qualis-SIS – facilitates automated curve generation, assay performance determination, and effortless interpretation of quantitative results. For optimal results, this kit should be partnered with the QC kits (e.g., PeptiQuant™ Daily LC-MS Platform Performance Kit) to ensure satisfactory performance of the instrument platform before proceeding.

Each Apo-14 kit contains the following items:

- Lyophilized SIS peptide mixture for spiking into a reference plasma sample digest for standard curve generation
- Lyophilized SIS peptide mixture for spiking into experimental sample digests ( $n = 20$  or 50)
- USB drive that contains the SOP (includes a troubleshooting guide), a platform-dependent acquisition method and acquisition worklist, a platform-dependent quantitative analysis method, Qualis-SIS input files (for control and experimental analysis), guideline values, and a certificate of analysis for the SIS peptide mixture

(continued)

**Figure.** Representative XIC trace of the 27 interference-free peptides in the Apo-14 kit panel. The quantifier transitions of the synthetic (SIS) and endogenous (natural or NAT) peptides are shown only for clarity. The determined concentrations were found to range from 1.6 mg/mL (for Apo A-I) to 7.8 µg/mL (for Apo C-I) in the pooled sample analyzed.

We have used the MouseExpress® L-Lysine ( $^{13}\text{C}_6$ , 99%) Mouse Feed Labeling Kit from Cambridge Isotope Labs (CIL) to label a colony of C57BL6 mice. We achieved full labeling efficiency by F2 generation in the muscle tissue, our tissue of interest and in all other tissues tested. In addition, CIL's MouseExpress® ( $^{15}\text{N}$ , 98%) Mouse Feed was used in non-generational labeling of a colony of C57BL6 mice. We achieved full labeling efficiency after 12 weeks of feeding the MouseExpress® ( $^{15}\text{N}$ , 98%) Mouse Feed. These labeled tissues are fueling a variety of studies for multiple principle investigators at our research institute to study Duchenne muscular dystrophy, myositis, urea cycle disorders and vanishing white matter disease.

# Microbiological and Pyrogen Tested Products

CIL offers microbiological and pyrogen testing for many of our research-grade products. For these products, denoted as -MPT, the bulk material is tested at release for *S. aureus*, *P. aeruginosa*, *E. coli*, *Salmonella* sp., aerobic bacteria, yeast, mold and bacterial endotoxins. Subsequent aliquots are not retested. Microbiological testing does not imply suitability for any intended use.

For most -MPT products, CIL also offers an Enhanced Technical Data Package (EDP). It includes all data that normally accompanies the -MPT product, plus additional information pertaining to the synthesis, purity and stability of the product. This is available for an additional charge. **Please see page 94 for further details.**
